

COVID-19: case 14

UOC Radiologia ASST Bergamo Est Direttore Dr Gianluigi Patelli

50-year-old male outpatient presented for a chest radiography. He reported with sick cough asthenia and fever for two days, with progressive worsening of his clinical conditions. pO₂: 93%.

Chest radiography

After the chest film, the patient underwent CT for a better characterization of his pulmonary abnormalities which were suspicious for Covid-19 interstitial pneumonia.

CT

The patient was then admitted to the ED to activate the procedures for nasopharyngeal swab and hospitalization.
